

Mobile apps | web systems | backend-connected products

Andrew Odom builds product-minded software with a bias for shipping.

I work across Flutter, TypeScript, Next.js, Supabase, and deployment workflows to turn useful ideas into clean, durable products.

Focus

Apps that feel clear, fast, and intentional.

Range

Frontend polish backed by practical infrastructure.

Stack

Flutter, TypeScript, Next.js, Supabase, Docker.

Profile

Useful software, edited until it feels obvious.

I like products with clean flows, readable code, and a small number of moving parts doing their jobs well.

Product flow

Interfaces should guide people without making them read a manual first. I care about the path from first click to finished task.

Full-stack sense

I can connect the visible experience to auth, data, payments, hosting, and the operational details that keep it running.

Maintainable polish

The goal is not decorative complexity. It is a product that looks sharp, responds smoothly, and stays easy to improve.

Selected builds

Project slots ready for the good stuff.

App and website links can drop straight into this section as they go public. The cards are built for direct live links, code links, or short case studies.

Resume Site

A fast public profile built to communicate skills, projects, and contact paths without making anyone open a mystery attachment.

Stack: HTML, CSS, Responsive UI

Public Workbench

A direct path to public repositories, experiments, and shipped pieces as the portfolio fills in.

Stack: TypeScript, Flutter, Supabase

App Showcase

A reserved home for the next mobile app, web product, or case study. Swap in the live URL when it is ready for visitors.

Stack: Flutter, RevenueCat, Backend

Experience

Built around the work, not buzzwords.

Use this space for the strongest roles, launches, metrics, or technical wins. The layout is ready for concise evidence.

Current focus

Software Developer

Building mobile and web products with Flutter, Next.js, TypeScript, Supabase, subscriptions, authentication, and practical deployment workflows.

Strengths

Product implementation

Turning loose requirements into clear interfaces, connected data flows, and releases that can be maintained after the first impressive demo.

Next edit

Measurable wins

Add specific outcomes here: shipped features, users, revenue, reliability improvements, speed gains, or anything that proves impact.

Stack

Tools I can actually move with.

The stack is intentionally practical: enough range to build complete products, not so much noise that the signal disappears.

Flutter ; Dart ; TypeScript ; Next.js ; React ; Supabase ; RevenueCat ; Docker ;

PDF-friendly

Need the paper version? Boldly old-school. I made one anyway.

Download the resume PDF, or print this page if you want the browser to do its best impression of a filing cabinet.

Contact

Have a role, project, or useful problem?

Send the context, the constraints, and what success should look like. I will bring product sense, clean implementation, and a healthy suspicion of unnecessary complexity.
